NEWS RELEASE

December 09, 2004

TRENCHING RETURNS 40M OF 740 G/T (21.6 OZ PER TON) SILVER ON THE LOMA DE LA PLATA ZONE AT NAVIDAD

IMA EXPLORATION INC. (IMR - TSX.V, IMXPF - OTC.BB) is please to announce that surface sampling has returned high silver grades over significant widths from the important new zone "Loma de la Plata" at the Company's 100% owned Navidad project in Patagonia, Argentina. Loma de la Plata is a new discovery that was announced on November 2, 2004, and is located approximately 4 km west of IMA's Galena Hill deposit.

Prospecting and a significantly expanded soil grid have been completed to the southeast of Loma de la Plata to evaluate a potential new trend parallel to the Navidad and Esperanza trends. Indicated resources at the Navidad project currently stand at 268 million ounces of silver (80.8 Mt @ 103 g/t silver, estimated using a 50 g/t silver equivalent cut-off).

LOMA DE LA PLATA ROCK CHIP SAMPLING RESULTS

SAMPLE LINE	LENGTH (METRES)	LENGTH WEIGHTED AVERAGE GRADESILVER (GRAMS PER TONNE)
Line 1	40.1	740
Line 2	39.3	322
Line 3	42.9	684
Line 4		
- sampled length	72.5	298
- bedrock not reached	63.4	-
Line 4 (gaps at zero grade)	135.9	159
Line 5	24.0	260
Line 6	15.0	384
Line 7		
- sampled length	29.5	499
- bedrock not reached	19.0	-
Line 7 (gaps at zero grade)	48.5	304

These results are the first systematic rock samples from this important new target at the Navidad Project. Twelve lines of channel samples covering an area of 400 by 400 meters have been completed at Loma de la Plata to date, results are available for the first seven. These seven sample lines tested an outcropping area of about 190 by 250 metres and comprised 153 individual samples ranging from 0.7 to 2.5 metres in length. Silver values of the individual samples ranged from 4 to 4,740 grams per tonne silver. Of the 153 samples, 127 contained greater than 50 grams per tonne silver.

Geological mapping indicates that the mineralization lies within a unit of massive latite volcanics with quartz eyes overlain by a sequence of limestones

Edgar Filing: IMA EXPLORATION INC - Form 6-K

and sandstones that dip to the northeast at 15 to 45 degrees. This host unit is underlain by a sequence of aphyric andesite or latite volcanic flows which to date have not been found to host mineralization. The horizontal width of the favourable quartz eye latite is about 300m, but the true thickness is interpreted to be significantly less due to the shallow dip. Mineralization consists of minor amounts of galena and green copper oxides with occasional fine-grained native silver and probable silver sulphides. The mineralization

PAGE 2

occurs in micro-veinlets and narrow veins and has the appearance and distribution of a stockwork with local development of hydrothermal breccia. Gangue minerals include calcite, barite and minor silica. Base metal values are economically insignificant and typically range from 0.05 to 0.2% for both lead and copper over the full lengths of the sample lines.

Soil and rock sampling results are pending from a large area to the southeast of Loma de la Plata. These were collected to test the theory that the mineralization at Loma de la Plata and the Sector Zeta showings may indicate a completely new trend of mineralization parallel to, but offset by about 3km, from the Navidad trend that includes Calcite, Navidad, Galena and Barite Hills. This new soil sampling coverage extends for roughly 7km to the southeast from Loma de la Plata and ranges in width from 1.5 to 2.5km. It is contiguous with the prior soil sampling. A total of 1366 new soils samples were collected including blanks and duplicates. Final results of these new soil samples are expected shortly.

Dr. Paul Lhotka is IMA's Qualified Person for the Navidad project and has overseen all aspects of the current program. For more information and a drawing depicting the work described herein please visit IMA's web site at <http://www.imaexploration.com/>.

IMA is well financed to execute several significant drill programs to continue to test the numerous remaining targets at Navidad as well as conduct a regional review of the Company's large adjoining land package. The Company has over 10 years experience in Argentina and is focused on the exploration and development of its' 100% owned Navidad silver discovery.

ON BEHALF OF THE BOARD
