Total		1,943	1,821	4,204

^{*}The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis. This approach has been adopted throughout this supplementary information.

Notes

- (i) EEV basis other income and expenditure represents the IFRS basis post-tax result, less the unwind of expected margins on the internal management of the assets of the covered business (as explained in note 14(c)(vi)).
- (ii) The comparative results have been prepared using previously reported average exchange rates for the period. For memorandum disclosure purposes note 2 presents the half year 2013 results on both actual exchange rates (AER) and constant exchange rates (CER) bases.

Notes on the EEV basis results

1 Basis of preparation

The EEV basis results have been prepared in accordance with the EEV Principles issued by the European Insurance CFO Forum in May 2004. Where appropriate, the EEV basis results include the effects of adoption of International Financial Reporting Standards (IFRS). The EEV results are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis.

The directors are responsible for the preparation of the supplementary information in accordance with the EEV Principles. The EEV basis results of 2014 and 2013 half years are unaudited. Except for the change in presentation of EEV results from pre-tax to post-tax, as described in the additional unaudited financial information for the full year 2013 announcement, the 2013 results have been derived from the EEV basis results supplement to the Company's statutory accounts for 2013. The supplement included an unqualified audit report from the auditors.

A detailed description of the EEV methodology and accounting presentation is provided in note 14.

2 Results analysis by business area

The half year 2013 comparative results are shown below on both actual exchange rates (AER) and constant exchange rates (CER) bases. The half year 2013 CER comparative results are translated at half year 2014 average exchange rates.

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

Notes

(a) The increase in unwind of discount and other expected returns of £13 million from £315 million for half year 2013 to £328 million for half year 2014 is impacted by a £(44) million adverse foreign currency translation effect. The underlying £57 million growth arises from the increase in the opening in-force value of £41 million, the effect of higher risk discount rates of £12 million and an increase in the return on net worth of £4 million.

- (b) In full year 2013 the credit of £19 million for mortality and morbidity assumption changes mainly reflected the beneficial effect arising from the renegotiation of a reinsurance agreement in Indonesia.
- (c) For full year 2013 the charge of $\pounds(23)$ million for persistency and withdrawals assumption changes reflected a number of offsetting items including the effect of strengthening lapse and premium holiday assumptions in Korea.
- (d) The favourable effect of mortality and morbidity experience in half year 2014 of £18 million (half year 2013: £22 million; full year 2013: £33 million) reflects better than expected experience, principally arising in Hong Kong, Indonesia and Singapore.
- (e) The negative persistency and withdrawals experience variance in half year 2014 of £(3) million (half year 2013:
- £(2) million) reflects the net effect of small variances across the territories. For full year 2013 the persistency and withdrawals experience variance of £36 million principally reflected favourable experience in Hong Kong and Indonesia.
- (f) The expense experience variance at half year 2014 was negative $\pounds(19)$ million (half year 2013: $\pounds(9)$ million; full year 2013: $\pounds(17)$ million). The variance arose in operations which are currently sub-scale (China, Malaysia Takaful and

Taiwan), in India where the business model continues to be adapted following the regulatory changes introduced in recent years, and from other temporary overruns.

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

Notes

- (a) The increase in unwind of discount and other expected returns of £5 million from £187 million for half year 2013 to £192 million for half year 2014 is impacted by a £(15) million adverse foreign currency translation effect. The underlying growth of £20 million arises from the increase in the opening in-force value £33 million offset by the effect of lower risk discount rates £(9) million and a decrease in the return on net worth £(4) million.
- (b) For half year and full year 2013, the effect of changes in persistency assumptions of £47 million primarily related to a reduction in lapse rates following the end of the surrender charge period, for variable annuity business.
- (c) Other changes in operating assumptions in 2013 include the effect of changes in mortality assumptions, the capitalised effect of changes in projected policyholder variable annuity fees and the effect of other regular updates to reflect experience.
- (d) The spread assumption for Jackson is determined on a longer-term basis, net of provision for defaults (see note 15(ii)(b)). The spread experience variance in half year 2014 of £108 million (half year 2013: £96 million; full year 2013:

£217 million) includes the positive effect of transactions undertaken to more closely match the overall asset and liability duration.

- (e) The amortisation of interest-related gains and losses reflects the fact that when bonds that are neither impaired nor deteriorating are sold and reinvested there will be a consequent change in the investment yield. The realised gain or loss is amortised into the result over the period when the bonds would have otherwise matured to better reflect the long-term returns included in operating profits.
- (f) The credit of £73 million in half year 2014 for other experience variances and other items includes positive impacts for persistency experience of £39 million (half year 2013: £15 million; full year 2013: £40 million) and mortality

experience. For all periods, other items also includes the impact of tax experience variances.

(iv) UK insurance operations

	2014 £m 2013* £r		m
	Half year	Half year	Full year
Unwind of discount and other expected returnsnote (a)	229	204	437
Effect of change in UK corporate tax ratenote (b)	-	-	98
Other itemsnote (c)	14	-	60
Total UK insurance operations	243	204	595

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

Notes

- (a) The increase in unwind of discount and other expected returns of £25 million from £204 million for half year 2013 to £229 million for half year 2014 reflects a £20 million increase in the return on net worth mainly arising from shareholder-backed annuity business, combined with the growth in the opening value of in-force of £7 million, partially offset by the negative effect of a lower risk discount rate of £(2) million.
- (b) For full year 2013, the effect of the change in UK corporate tax rates of £98 million reflected the combined effect of the reductions in corporate rates from 23 per cent to 21 per cent from April 2014 and 21 per cent to 20 per cent from

April 2015 which were both enacted in July 2013. The beneficial effect arose from the increase in the present value of the post-tax projected cash flows of the in-force business at 1 January 2013.

- (c) Other items of £14 million for half year 2014 (full year 2013: £60 million) principally reflect the positive effects of rebalancing the investment portfolio backing annuity business (see note 14(c)(ii)).
- 5 Loss attaching to held for sale Japan Life business

The losses reflected in the 2013 results reflect the reductions in EEV carrying value to equal the expected net proceeds from the sale of the Group's life insurance business in Japan, PCA Life Insurance Company Ltd. when completed.

6 Domestication of the Hong Kong branch business

On 1 January 2014, following consultation with policyholders of PAC and regulators and court approval, the Hong Kong branch of PAC was transferred to separate subsidiaries established in Hong Kong. As a consequence of this restructuring, adjustments in respect of required capital, and the cost of that capital have been recognised in the EEV basis of results. These adjustments arose from the transfer of capital that was previously held within the UK business in respect of the Hong Kong branch operations and additional capital requirements that arise from the newly established subsidiaries. These have been included as an adjustment to opening balances within the movement in net worth and value of in-force business (note 12) and in the statement of movement in shareholders' equity (note 11) in 2014 as follows:

		£m		
Adjustment to shareholders' equity at	Free surplus	Total	Value of	Total

1 January 2014		Required capital	net worth	in-force business	long-term business
					operations
Asia operations	(104)	104	-	(40)	(40)
UK insurance operations	69	(69)	-	29	29
Opening adjustment	(35)	35	-	(11)	(11)

The net EEV basis effect of $\pounds(11)$ million represents the cost of holding higher required capital levels in the stand-alone Hong Kong shareholder-backed long-term insurance business.

The post-tax costs incurred enabling the domestication in the first half of 2014 were £7 million (full year 2013: £28 million).

7 Short-term fluctuations in investment returns

Short-term fluctuations in investment returns, net of the related change in the time value of cost of options and guarantees, arise as follows:

(i) Group Summary

o Summury	2014 £m	2013*	£m
	Half year	Half year	Full year
Insurance operations:	•	•	•
Asianote (ii)	245	(223)	(308)
USnote (iii)	95	(271)	(280)
UKnote (iv)	112	(70)	28
	452	(564)	(560)
Other operations	(20)	(23)	(4)
Total	432	(587)	(564)

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

(ii) Asia operations

The short-term fluctuations in investment returns for Asia operations comprise amounts in respect of the following business operations:

	2014 £m	2013* £m	
	Half year	Half year	Full year
Hong Kong	121	(122)	(178)
Singapore	46	(106)	(80)
Other	78	5	(50)
Total Asia operations	245	(223)	(308)

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

These fluctuations mainly arise from decreases (2014) and increases (2013) in long-term interest rates as they affect the value of bonds in the portfolios backing liabilities. The £78 million credit for other operations in half year 2014 principally arises in Taiwan of £21 million for unrealised gains on bonds, and in Indonesia of £21 million for an

increase in future expected fee income for unit-linked business. For full year 2013 the $\pounds(50)$ million fluctuation included $\pounds(44)$ million arising in Indonesia for a decrease in future expected fee income, arising from falls in equity markets.

(iii) US operations

The short-term fluctuations in investment returns for US operations comprise the following items:

	2014 £m 2013* £m		£m
	Half year	Half year	Full year
Investment return related experience on fixed income securities note (a)	(2)	8	13
Investment return related impact due to changed expectation of profits on in-force			
variable annuity business in future periods based on current period			
separate account return, net of related hedging activity note (b)	75	(307)	(377)
Other items including actual less long-term return on equity based			
investmentsnote (c)	22	28	84
Total US operations	95	(271)	(280)

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

Notes

- (a) The (charge) credit relating to fixed income securities comprises the following elements:
- the excess of actual realised gains (losses) over the amortisation of interest related realised gains and losses recorded in the profit and loss account;
 - credit loss experience (versus the longer-term assumption); and
 - the impact of changes in the asset portfolio.
- (b) This item reflects the net impact of:
- variances in projected future fees and future benefit costs arising from the effect of market fluctuations on the growth in separate account asset values in the current reporting period; and
- related hedging activity arising from realised and unrealised gains and losses on equity related hedges and interest rate options.
- (c) For full year 2013, other items of £84 million primarily reflected a beneficial impact of the excess of actual over assumed return from investments in limited partnerships.

(iv) UK insurance operations

The short-term fluctuations in investment returns for UK insurance operations arise from the following types of business:

	2014 £m	2013* £m	
	Half year	Half year	Full year
Shareholder-backed annuitynote (a)	35	(48)	(58)
With-profits, Unit-linked and othernote (b)	77	(22)	86
	112	(70)	28

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

Notes

(a) Short-term fluctuations in investment returns for shareholder-backed annuity business comprise: (1) gains (losses) on surplus assets compared to the expected long-term rate of return reflecting reductions/increases in corporate

bond and gilt yields; (2) the difference between actual and expected default experience; and (3) the effect of

mismatching for assets and liabilities of different durations and other short-term fluctuations in investment returns.

(b) The short-term fluctuations in investment returns for with-profits, unit-linked and other business primarily arise from the excess of actual over expected returns for with-profits business. The total return on the fund (including \

unallocated surplus) in half year 2014 was 4.2 per cent compared to an assumed rate of return of 2.9 per cent (half year 2013: 2.7 per cent total return compared to assumed rate of 2.9 per cent; full year 2013: 8.0 per cent total return $\$

compared to assumed rate of 6.0 per cent). In addition, for full year 2013 the amount included the effect of a partial hedge of future shareholder transfers expected to emerge from the UK's with-profits sub-fund taken out during

2013. This hedge reduces the risks arising from equity market declines.

8 Effect of changes in economic assumptions

The effects of changes in economic assumptions for in-force business, net of the related change in the time value of cost of options and guarantees, included within post-tax profit (including actual investment returns) arise as follows:

(i) Group Summary

	2014 £m	2013* £m		
	Half year	Half year	Full year	
Asia operationsnote (ii)	(145)	272	255	
US operationsnote (iii)	(158)	40	242	
UK insurance operationsnote (iv)	(65)	222	132	
Total	(368)	534	629	

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

(ii) Asia operations

The effect of changes in economic assumptions for Asia operations comprise amounts in respect of the following business operations:

	2014 £m	2013*	£m
	Half year	Half year	Full year
Hong Kong	(73)	288	289
Malaysia	(31)	(27)	(62)
Indonesia	12	(101)	(176)
Singapore	(11)	62	90
Taiwan	(29)	52	92
Other	(13)	(2)	22
Total Asia operations	(145)	272	255

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

The negative effect of £(145) million in half year 2014 principally arises in Hong Kong, Singapore and Taiwan, mainly reflecting reductions in fund earned rates for participating business, driven by the decrease in long-term interest rates.

The positive impacts in half year 2013 of £272 million and full year 2013 of £255 million reflected the overall impact of an increase in fund earned rates for participating business, principally arising in Hong Kong, Singapore and Taiwan, mainly due to the increase in long-term interest rates. There were partial offsets arising in Indonesia and

Malaysia, mainly reflecting the negative impact of calculating health and protection future profits at a higher discount rate.

(iii) US operations

The effect of changes in economic assumptions for US operations reflects the following:

	2014 £m 2013* £m		£m
	Half year	Half year	Full year
Effect of changes in 10-year treasury rates:			
Fixed annuity and other general account business			
note (a)	71	(147)	(244)
Variable annuity businessnote (b)	(229)	187	382
Decrease in additional allowance for credit risknote (c)	-	-	104
Total note (d)	(158)	40	242

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

Notes

(a) For fixed annuity and other general account business the credit of £71 million in half year 2014 principally arises from the effect of a lower discount rate, driven by the 50 basis points reduction in the risk-free rate. The projected cash flows for this business principally reflect projected spread, with secondary effects on the cash flows also resulting from changes to assumed future yields and resulting policyholder behaviour. The charge of £(147) million in half year 2013 (full year 2013: £(244) million) principally arose from the effect of a higher discount rate on the opening value of the in-force book, driven by the 70 basis points increase in the risk-free rate (full year 2013: 130 basis

points)

- (b) For variable annuity business, the charge of £(229) million principally reflects the decrease in the projected fee income and an increase in projected benefit costs, arising from the decrease in the rate of the assumed future return on the underlying separate account return assets, driven by the 50 basis points decrease in the risk free rate. There is a partial offset arising from the decrease in the risk discount rate applied to those cash flows. The credit of £187 million in half year 2013 and £382 million in full year 2013 reflected an increase in the risk free rate of 70 basis points and 130 basis points respectively.
- (c) For full year 2013 the £104 million effect of the decrease in the additional allowance for credit risk within the risk discount rate reflected the reduction in credit spreads and represented a 50 basis points decrease for spread business and a 10 basis points decrease for variable annuity business, representing the proportion of business invested in the general account (as described in note 14(b)(iii)).
- (d) The overall credit in half year 2013 of £40 million and in full year 2013 of £242 million included a charge of £(13) million for the effect of the change in required capital from 235 per cent to 250 per cent of risk-based capital.

(iv) UK insurance operations

The effect of changes in economic assumptions of a charge of $\pounds(65)$ million for UK insurance operations for half year 2014 comprises the following:

	2014 £m 2013* £m		£m
	Half year	Half year	Full year
Effect of changes in expected long-term rates of return, risk			
discount rates and other changes:			
Shareholder-backed annuity businessnote (a)	73	(106)	(56)
With-profits and other businessnote (b)	(138)	328	188
	(65)	222	132

* The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the half year and full year 2013 results are shown on a comparable basis - see note 1.

Notes

- (a) For shareholder-backed annuity business the overall effect reflects changes in expected long-term rates of return and risk discount rates which incorporate a default allowance for both best estimate defaults and in respect of the additional credit risk provisions (as shown in note 15(iii)(b)).
- (b) For with-profits and other business the total charge in half year 2014 of £(138) million (half year 2013: credit of £328 million; full year 2013: credit of £188 million) includes the net effect of the changes in fund earned rates and risk

discount rate (as shown in note 15(iii)), driven by the 30 basis points decrease (half year 2013: increase of 70 basis points; full year 2013: increase of 120 basis points) in the 15-year government bond rate.

¹⁰ Analysis of movement in free surplus

Free surplus is the excess of the regulatory basis net assets for EEV reporting purposes (net worth) over the capital required to support the covered business. Where appropriate, adjustments are made to the net worth so that backing assets are included at fair value rather than cost so as to comply with the EEV Principles.

(i) Underlying free surplus generated

The half year 2013 comparative results are shown below on both actual exchange rates (AER) and constant exchange rates (CER) bases. The half year 2013 CER comparative results are translated at half year 2014 average exchange rates.

Notes

⁽i) Free surplus invested in new business represents amounts set aside for required capital and acquisition costs.

- (ii) For the purposes of this analysis, free surplus for asset management operations and the UK general insurance commission is taken to be IFRS basis shareholders' equity.
- (iii) Non-operating items are principally short-term fluctuations in investment returns and the effect of changes in economic assumptions for long-term business operations.
- (iv) Net cash flows to parent company for long-term business operations reflect the flows as included in the holding company cash flow at transaction rates.

2014 C--

(v) Exchange movements, timing differences and other items represent:

		2014 £m

benefit pension schemes	2	6	8
Othernote (vi)	9	(31)	(22)
	29	(34)	(5)

- (vi) Other primarily reflects the effect of timing differences, contingent loan funding, as shown in note 12(i), and other non-cash items.
- (vii) Investment in new business includes the annual amortisation charge for amounts incurred to secure exclusive distribution rights through our bancassurance partners at a rate that reflects the pattern in which the future economic benefits are expected to be consumed by reference to new business levels. Included within the overall free surplus balance of our Asian life entities is £293 million representing unamortised amounts incurred to secure exclusive distribution rights through our bancassurance partners. These amounts exclude £818 million of Asia distribution rights intangibles that are financed by loan arrangements from central companies, the costs of which are allocated to the Asia life segment as the amortisation cost is incurred.

Notes

- (i) For the purposes of the table above, goodwill related to Asia long-term operations is included in Other operations.
- (ii) Intra-group dividends (including statutory transfers) represent dividends that have been declared in the period and amounts accrued in respect of statutory transfers. The amounts included in note 10 for these items are as per the holding company cashflow at transaction rates. The difference primarily relates to intra-group loans, timing
- differences arising on statutory transfers, and other non-cash items. (iii) Investment in operations reflects increases in share capital.
- (iv) The additional retained loss on an EEV basis for Other operations primarily represents the mark to market value adjustment for holding company net borrowings of a charge of £(452) million (half year 2013: £(360) million; full
 - year 2013: £(392) million), as shown in note 9.
- (v) The post-tax charge for the shareholders' share of actuarial and other gains and losses on defined benefit schemes comprises:

Notes

Contingent loan funding represents amounts whose repayment to the lender is contingent upon future surpluses emerging from certain contracts specified under the arrangement. If insufficient surplus emerges on those

contracts, there is no recourse to other assets of the Group and the liability is not payable to the degree of shortfall.

Net value of in-force business	8,143	4,403	4,893	17,439

(v) The increase in the cost of time value of guarantees for US operations from £(146) million at full year 2013 to £(273) million at half year 2014 primarily relates to variable annuity business. It mainly arises from the decrease in the

expected long-term separate account rate of return following the 50 basis points decline in the US 10-year treasury bond rate and the impact from new business written in the period, partly offset by the strong equity performance.

13 Sensitivity of results to alternative assumptions

(a) Sensitivity analysis - economic assumptions

The tables below show the sensitivity of the embedded value as at 30 June 2014 (31 December 2013) and the new business contribution after the effect of required capital for half year 2014 and full year 2013 to:

- 1 per cent increase in the discount rates;
- 1 per cent increase and decrease in interest rates, including all consequential changes (assumed investment returns for all asset classes, market values of fixed interest assets, risk discount rates);
- 1 per cent rise in equity and property yields;
- 10 per cent fall in market value of equity and property assets (embedded value only);
- The statutory minimum capital level (by contrast to EEV basis required capital), (for embedded value only);
- 5 basis point increase in UK long-term expected defaults; and
- 10 basis point increase in the liquidity premium for UK annuities.

In each sensitivity calculation, all other assumptions remain unchanged except where they are directly affected by the revised economic conditions.

The sensitivities shown above are for the impact of instantaneous changes on the embedded value of long-term business operations and include the combined effect on the value of in-force business and net assets at the balance

^{*} The 2014 EEV results of the Group are presented on a post-tax basis and, accordingly, the full year 2013 results are shown on a comparable basis - see note 1.

sheet dates indicated. If the change in assumption shown in the sensitivities were to occur, then the effect shown above would be recorded within two components of the profit analysis for the following year. These are for the effect of economic assumption changes and, to the extent that asset value changes are included in the sensitivities, within short-term fluctuations in investment returns. In addition to the sensitivity effects shown above, the other components of the profit for the following period would be calculated by reference to the altered assumptions, for example new business contribution and unwind of discount, together with the effect of other changes such as altered corporate bond spreads. In addition for Jackson, the fair value movements on assets backing surplus and required capital which are taken directly to shareholders' equity would also be affected by changes in interest rates.

14 Methodology and accounting presentation

(a) Covered business

The EEV results for the Group are prepared for 'covered business', as defined by the EEV Principles. Covered business represents the Group's long-term insurance business for which the value of new and in-force contracts is attributable to shareholders. The post-tax EEV basis results for the Group's covered business are then combined with the post-tax IFRS basis results of the Group's other operations. Under the EEV Principles, the results for covered business incorporate the projected margins of attaching internal asset management, as described in note 14(c)(vi).

The definition of long-term business operations is consistent with previous practice and comprises those contracts falling under the definition for regulatory purposes together with, for US operations, contracts that are in substance the same as guaranteed investment contracts (GICs) but do not fall within the technical definition.

Covered business comprises the Group's long-term business operations, with two exceptions:

- the closed Scottish Amicable Insurance Fund (SAIF) which is excluded from covered business. SAIF is a ring-fenced sub-fund of the Prudential Assurance Company (PAC) long-term fund, established by a Court approved Scheme of Arrangement in October 1997. SAIF is closed to new business and the assets and liabilities of the fund are wholly attributable to the policyholders of the fund.
- the presentational treatment of the Group's principal defined benefit pension scheme, the Prudential Staff Pension Scheme (PSPS). The partial recognition of the surplus for PSPS is recognised in 'Other' operations, as described in note 14(c)(vii).

A small amount of UK group pensions business is also not modelled for EEV reporting purposes.

- (b) Methodology
- (i) Embedded value

Overview

The embedded value is the present value of the shareholders' interest in the earnings distributable from assets allocated to covered business after sufficient allowance has been made for the aggregate risks in that business. The shareholders' interest in the Group's long-term business comprises:

- the present value of future shareholder cash flows from in-force covered business (value of in-force business), less deductions for:
 - the cost of locked-in required capital;
 - the time value of cost of options and guarantees;
- locked-in required capital; and
- the shareholders' net worth in excess of required capital (free surplus).

The value of future new business is excluded from the embedded value.

Notwithstanding the basis of presentation of results (as explained in note 14(c)(iv)) no smoothing of market or account balance values, unrealised gains or investment return is applied in determining the embedded value or profit. Separately, the analysis of profit is delineated between operating profit based on longer-term investment returns and other constituent items (as explained in note 14(c)(i)).

Valuation of in-force and new business

The embedded value results are prepared incorporating best estimate assumptions about all relevant factors including levels of future investment returns, expenses, persistency and mortality. These assumptions are used to project future cash flows. The present value of the future cash flows is then calculated using a discount rate which reflects both the time value of money and the non-diversifiable risks associated with the cash flows that are not otherwise allowed for.

Best estimate assumptions

Best estimate assumptions are used for the cash flow projections, where best estimate is defined as the mean of the distribution of future possible outcomes. The assumptions are reviewed actively and changes are made when evidence exists that material changes in future experience are reasonably certain.

Assumptions required in the calculation of the value of options and guarantees, for example relating to volatilities and correlations, or dynamic algorithms linking liabilities to assets, have been set equal to the best estimates and, wherever material and practical, reflect any dynamic relationships between the assumptions and the stochastic variables.

Demographic assumptions

Persistency, mortality and morbidity assumptions are based on an analysis of recent experience but also reflect expected future experience. Where relevant, when calculating the time value of financial options and guarantees, policyholder withdrawal rates vary in line with the emerging investment conditions according to management's expectations.

Expense assumptions

Expense levels, including those of service companies that support the Group's long-term business operations, are based on internal expense analysis investigations and are appropriately allocated to acquisition of new business and renewal of in-force business. Exceptional expenses are identified and reported separately. For mature business, it is Prudential's policy not to take credit for future cost reduction programmes until the savings have been delivered. For businesses which are currently sub-scale (China, Malaysia Takaful and Taiwan) and India (where the business model is being adapted as the industry continues to adjust to regulatory changes), expense overruns are reported where these are expected to be short-lived.

For Asia operations, the expenses comprise costs borne directly and recharged costs from the Asia regional head office, that are attributable to covered business. The assumed future expenses for these operations also include projections of these future recharges. Development expenses are charged as incurred.

Corporate expenditure which is included in other income and expenditure and comprises:

- Expenditure for Group head office, to the extent not allocated to the PAC with-profits funds, together with Solvency II implementation and restructuring costs, which are charged to the EEV basis results as incurred; and
- Expenditure of the Asia regional head office that is not allocated to the covered business or asset management operations which is charged as incurred. These costs are primarily for corporate related activities and are included within corporate expenditure.

Principal economic assumptions

The EEV basis results for the Group's operations have been determined using economic assumptions where the pre-tax long-term expected rates of return on investments and risk discount rates are set by reference to period end rates of return on government bonds.

Expected returns on equity and property asset classes and corporate bonds are derived by adding a risk premium, based on the Group's long-term view, to the risk-free rate.

The total profit that emerges over the lifetime of an individual contract as calculated using the embedded value basis is the same as that calculated under the IFRS basis. Since the embedded value basis reflects discounted future cash flows, under this methodology the profit emergence is advanced, thus more closely aligning the timing of the recognition of profits with the efforts and risks of current management actions, particularly with regard to business sold during the period.

New business

In determining the EEV basis value of new business, premiums are included in projected cash flows on the same basis of

distinguishing annual and single premium business as set out for statutory basis reporting.

New business premiums reflect those premiums attaching to covered business, including premiums for contracts classified as

investment products for IFRS basis reporting. New business premiums for regular premium products are shown on an annualised basis. Internal vesting business is classified as new business where the contracts include an open market option.

The post-tax contribution from new business represents profits determined by applying operating assumptions as at the end of the period.

For UK immediate annuity business and single premium Universal Life products in Asia, primarily in Singapore, the new business contribution is determined by applying economic assumptions reflecting point-of-sale market conditions. This is consistent with how the business is priced as crediting rates are linked to yields on specific assets and the yield is locked-in when the assets are purchased at the point-of-sale of the policy. For other business within the Group, end of period economic assumptions are used.

New business profitability is a key metric for the Group's management of the development of the business. In addition, post-tax new business margins are shown by reference to annual premium equivalents (APE) and the present value of new business premiums (PVNBP). These margins are calculated as the percentage of the value of new business profit to APE and PVNBP. APE is calculated as the aggregate of regular new business amounts and one-tenth of single new business amounts. PVNBP is calculated as equalling single premiums plus the present value of expected premiums of new regular premium business, allowing for lapses and other assumptions made in determining the EEV new business contribution.

Valuation movements on investments

With the exception of debt securities held by Jackson, investment gains and losses during the period (to the extent that changes in capital values do not directly match changes in liabilities) are included directly in the profit for the period and shareholders' equity as they arise.

The results for any covered business conceptually reflect the aggregate of the IFRS results and the movements on the additional shareholders' interest recognised on the EEV basis. Thus the start point for the calculation of the EEV results for Jackson, as for other businesses, reflects the market value movements recognised on the IFRS basis.

However, in determining the movements on the additional shareholders' interest, the basis for calculating the Jackson EEV result acknowledges that, for debt securities backing liabilities, the aggregate EEV results reflect the fact that the value of in-force business instead incorporates the discounted value of future spread earnings. This value is not affected generally by short-term market movements on securities that broadly speaking, are held for the longer-term.

Fixed income securities backing the free surplus and required capital for Jackson are accounted for at fair value. However, consistent with the treatment applied under IFRS for Jackson securities classified as available-for-sale, movements in unrealised appreciation on these securities are accounted for in equity rather than in the income statement, as shown in the movement in shareholders' equity.

Cost of capital

A charge is deducted from the embedded value for the cost of capital supporting the Group's long-term business. This capital is referred to as required capital. The cost is the difference between the nominal value of the capital and the discounted value of the projected releases of this capital allowing for investment earnings (post-tax) on the capital.

The annual result is affected by the movement in this cost from year-to-year which comprises a charge against new business profit and generally a release in respect of the reduction in capital requirements for business in force as this runs off.

Where required capital is held within a with-profits long-term fund, the value placed on surplus assets in the fund is already discounted to reflect its release over time and no further adjustment is necessary in respect of required capital.

Financial options and guarantees

Nature of financial options and guarantees in Prudential's long-term business

Asia operations

Subject to local market circumstances and regulatory requirements, the guarantee features described below in respect of UK business broadly apply to similar types of participating contracts principally written in the Hong Kong, Singapore and Malaysia. Participating products have both guaranteed and non-guaranteed elements.

There are also various non-participating long-term products with guarantees. The principal guarantees are those for whole of life contracts with floor levels of policyholder benefits that accrue at rates set at inception and do not vary subsequently with market conditions.

US operations (Jackson)

The principal financial options and guarantees in Jackson are associated with the fixed annuity and variable annuity (VA) lines of business.

Fixed annuities provide that, at Jackson's discretion, it may reset the interest rate credited to policyholders' accounts, subject to a guaranteed minimum. The guaranteed minimum return varies from 1.0 per cent to 5.5 per cent for all periods throughout these results, depending on the particular product, jurisdiction where issued, and date of issue. For half year 2014, 86 per cent (half year and full year 2013: 86 per cent) of the account values on fixed annuities are for policies with guarantees of 3 per cent or less. The average guarantee rate is 2.8 per cent for all periods throughout these results.

Fixed annuities also present a risk that policyholders will exercise their option to surrender their contracts in periods of rapidly rising interest rates, possibly requiring Jackson to liquidate assets at an inopportune time.

Jackson issues VA contracts where it contractually guarantees to the contract holder either: a) return of no less than total deposits made to the contract adjusted for any partial withdrawals; b) total deposits made to the contract adjusted for any partial withdrawals plus a minimum return; or c) the highest contract value on a specified anniversary date adjusted for any withdrawals following the specified contract anniversary. These guarantees include benefits that are payable at specified dates during the accumulation period (Guaranteed Minimum Withdrawal Benefit (GMWB)), as death benefits (Guaranteed Minimum Death Benefits (GMDB)) or as income benefits (Guaranteed Minimum Income Benefits (GMIB)). These guarantees generally protect the policyholder's value in the event of poor equity market performance. Jackson hedges the GMDB and GMWB guarantees through the use of equity options and futures contracts, and fully reinsures the GMIB guarantees.

Jackson also issues fixed index annuities that enable policyholders to obtain a portion of an equity-linked return while providing a guaranteed minimum return. The guaranteed minimum returns would be of a similar nature to those described above for fixed annuities.

UK insurance operations

For covered business the only significant financial options and guarantees in the UK insurance operations arise in the with-profits fund.

With-profits products provide returns to policyholders through bonuses that are smoothed. There are two types of bonuses - annual and final. Annual bonuses are declared once a year and, once credited, are guaranteed in accordance with the terms of the particular product. Unlike annual bonuses, final bonuses are guaranteed only until the next bonus declaration. The with-profits fund also held a provision on the Pillar I Peak 2 basis of £36 million at 30 June 2014 (30 June 2013: £47 million; 31 December 2013: £36 million) to honour guarantees on a small number of guaranteed annuity option products.

The only material guaranteed surrender values relate to investments in the PruFund range of with-profits funds. For these products the policyholder can choose to pay an additional management charge. In return, at the selected guarantee date, the fund will be increased if necessary to a guaranteed minimum value (based on the initial investment adjusted for any prior withdrawals). The with-profits fund held a reserve of £30 million at 30 June 2014 (30 June 2013: £52 million; 31 December 2013: £36 million) in respect of this guarantee.

The Group's main exposure to guaranteed annuity options in the UK is through the non-covered business of SAIF. A provision on the Pillar I Peak 2 basis of £421 million was held in SAIF at 30 June 2014 (30 June 2013: £325 million; 31 December 2013: £328 million) to honour the guarantees. As described in note 14(a) above, the assets and liabilities are wholly attributable to the policyholders of the fund. Therefore the movement in the provision has no direct impact on shareholders.

Time value

The value of financial options and guarantees comprises two parts. One is given by a deterministic valuation on best estimate assumptions (the intrinsic value). The other part arises from the variability of economic outcomes in the future (the time value).

Where appropriate, a full stochastic valuation has been undertaken to determine the time value of the financial options and guarantees.

The economic assumptions used for the stochastic calculations are consistent with those used for the deterministic calculations. Assumptions specific to the stochastic calculations reflect local market conditions and are based on a combination of actual market data, historic market data and an assessment of long-term economic conditions. Common principles have been adopted across the Group for the stochastic asset models, for example, separate modelling of individual asset classes but with an allowance for correlation between the various asset classes. Details of the key characteristics of each model are given in notes 15(iv),(v) and (vi).

In deriving the time value of financial options and guarantees, management actions in response to emerging investment and fund solvency conditions have been modelled. Management actions encompass, but are not confined to investment allocation decisions, levels of reversionary and terminal bonuses and credited rates. Bonus rates are projected from current levels and varied in accordance with assumed management actions applying in the emerging investment and fund solvency conditions.

In all instances, the modelled actions are in accordance with approved local practice and therefore reflect the options actually available to management. For the PAC with-profits fund, the actions assumed are consistent with those set out

in the Principles and Practices of Financial Management which explains how regular and final bonus rates within the discretionary framework are determined, subject to the general legislative requirements applicable.

(ii) Level of required capital

In adopting the EEV Principles, Prudential has based required capital on its internal targets subject to it being at least the local statutory minimum requirements. For with-profits business written in a segregated life fund, as is the case in Asia and the UK, the capital available in the fund is sufficient to meet the required capital requirements. For shareholder-backed business the following capital requirements apply:

- Asia operations: the level of required capital has been set to an amount at least equal to the higher of local statutory requirements and the internal target;
- US operations: the level of required capital has been set at 250 per cent of the risk-based capital required by the National Association of Insurance Commissioners (NAIC) at the Company Action Level (CAL); and
- UK insurance operations: the capital requirements are set to an amount at least equal to the higher of Pillar I and Pillar II requirements for shareholder-backed business of UK insurance operations as a whole.

(iii) Allowance for risk and risk discount rates

Overview

Under the EEV Principles, discount rates used to determine the present value of future cash flows are set by reference to risk-free rates plus a risk margin. The risk margin should reflect any non-diversifiable risk associated with the emergence of distributable earnings that is not allowed for elsewhere in the valuation. Prudential has selected a granular approach to better reflect differences in market risk inherent in each product group. The risk discount rate so derived does not reflect an overall Group market beta but instead reflects the expected volatility associated with the cash flows for each product category in the embedded value model.

Since financial options and guarantees are explicitly valued under the EEV methodology, discount rates under EEV are set excluding the effect of these product features.

The risk margin represents the aggregate of the allowance for market risk, additional allowance for credit risk where appropriate, and allowance for non-diversifiable non-market risk. No allowance is required for non-market risks where these are assumed to be fully diversifiable.

Market risk allowance

The allowance for market risk represents the beta multiplied by an equity risk premium. Except for UK shareholder-backed annuity business (as explained below) such an approach has been used for all of the Group's businesses.

The beta of a portfolio or product measures its relative market risk. The risk discount rates reflect the market risk inherent in each product group and hence the volatility of product cash flows. These are determined by considering how the profits from each product are affected by changes in expected returns on various asset classes. By converting this into a relative rate of return it is possible to derive a product specific beta.

Product level betas reflect the most recent product mix to produce appropriate betas and risk discount rates for each major product grouping.

Additional credit risk allowance

The Group's methodology is to allow appropriately for credit risk. The allowance for total credit risk is to cover:

- expected long-term defaults;
- credit risk premium (to reflect the volatility in downgrade and default levels); and
- short-term downgrades and defaults.

These allowances are initially reflected in determining best estimate returns and through the market risk allowance described above. However, for those businesses which are largely backed by holdings of debt securities these allowances in the projected returns and market risk allowances may not be sufficient and an additional allowance may be appropriate.

The practical application of the allowance for credit risk varies depending upon the type of business as described below.

Asia operations

For Asia operations, the allowance for credit risk incorporated in the projected rates of return and the market risk allowance are sufficient. Accordingly no additional allowance for credit risk is required.

The projected rates of return for holdings of corporate bonds comprise the risk-free rate plus an assessment of long-term spread over the risk-free rate.

US operations (Jackson)

For Jackson business, the allowance for long-term defaults is reflected in the risk margin reserve (RMR) charge which is deducted in determining the projected spread margin between the earned rate on the investments and the policyholder crediting rate.

The risk discount rate incorporates an additional allowance for credit risk premium and short-term downgrades and defaults as shown in note 15(ii). In determining this allowance a number of factors have been considered. These factors, in particular, include:

- (a) How much of the credit spread on debt securities represents an increased credit risk not reflected in the RMR long-term default assumptions, and how much is liquidity premium (which is the premium required by investors to compensate for the risk of longer-term investments which cannot be easily converted into cash, and converted at the fair market value). In assessing this effect, consideration has been given to a number of approaches to estimating the liquidity premium by considering recent statistical data; and
- (b) Policyholder benefits for Jackson fixed annuity business are not fixed. It is possible in adverse economic scenarios to pass on a component of credit losses to policyholders (subject to guarantee features) through lower investment return rates credited to policyholders. Consequently, it is only necessary to allow for the balance of the credit risk in the risk discount rate.

The level of the additional allowance is assessed at each reporting period to take account of prevailing credit conditions and as the business in force alters over time. The additional allowance for variable annuity business has been set at one-fifth of the non-variable annuity business to reflect the proportion of the allocated holdings of general account debt securities.

The level of allowance differs from that for UK annuity business for investment portfolio differences and to take account of the management actions available in adverse economic scenarios to reduce crediting rates to policyholders, subject to guarantee features of the products.

UK operations

(1) Shareholder-backed annuity business

For Prudential's UK shareholder-backed annuity business, Prudential has used a market consistent embedded value (MCEV) approach to derive an implied risk discount rate which is then applied to the projected best estimate cash flows.

In the annuity MCEV calculations as the assets are generally held to maturity to match long duration liabilities, the future cash flows are discounted using the swap yield curve plus an allowance for liquidity premium based on Prudential's assessment of the expected return on the assets backing the annuity liabilities after allowing for:

- (a) expected long-term defaults derived as a percentage of historical default experience based on Moody's data for the period 1970 to 2009 and the definition of the credit rating assigned to each asset held is the second highest credit rating published by Moody's, Standard & Poor's and Fitch;
- (b) a credit risk premium, which is derived as the excess over the expected long-term defaults, of the 95th percentile of historical cumulative defaults based on Moody's data for the period 1970 to 2009, and subject to a minimum margin over expected long-term defaults of 50 per cent;
- (c) an allowance for a 1 notch downgrade of the asset portfolio subject to credit risk and;
- (d) an allowance for short-term downgrades and defaults.

For the purposes of presentation in the EEV results, the results on this basis are reconfigured. Under this approach the projected earned rate of return on the debt securities held is determined after allowing for expected long-term defaults and, where necessary, an additional allowance for an element of short-term downgrades and defaults to bring the allowance in the earned rate up to best estimate levels. The allowances for credit risk premium, 1 notch downgrade and the remaining element of short-term downgrade and default allowances are incorporated into the risk margin included in the discount rate, as shown in note 15(iii)(b).

(2) With-profits fund non-profit annuity business

For UK non-profit annuity business including that written by Prudential Annuities Limited (PAL) the basis for determining the aggregate allowance for credit risk is consistent with that applied for UK shareholder-backed annuity business (as described above). The allowance for credit risk in PAL is taken into account in determining the projected cash flows to the with-profits fund, which are in turn discounted at the risk discount rate applicable to all of the projected cash flows of the fund.

(3) With-profits fund holdings of debt securities

The UK with-profits fund holds debt securities as part of its investment portfolio backing policyholder liabilities and unallocated surplus. The assumed earned rate for with-profit holdings of corporate bonds is defined as the risk-free rate plus an assessment of the long-term spread over gilts, net of expected long-term defaults. This approach is similar to that applied for equities and properties for which the projected earned rate is defined as the risk-free rate plus a long-term risk premium.

Allowance for non-diversifiable non-market risks

The majority of non-market and non-credit risks are considered to be diversifiable. Finance theory cannot be used to determine the appropriate component of beta for non-diversifiable non-market risks since there is no observable risk premium associated with it that is akin to the equity risk premium. Recognising this, a pragmatic approach has been applied.

A base level allowance of 50 basis points is applied to cover the non-diversifiable non-market risks associated with the Group's businesses. For the Group's US business and UK business other than shareholder-backed annuity, no additional allowance is necessary. For UK shareholder-backed annuity business a further allowance of 50 basis points is used to reflect the longevity risk which is of particular relevance. For the Group's Asia operations in China, India, Indonesia, the Philippines, Taiwan, Thailand and Vietnam, additional allowances are applied for emerging market risk ranging from 100 to 250 basis points.

(iv) With-profits business and the treatment of the estate

The proportion of surplus allocated to shareholders from the PAC with-profits fund has been based on the present level of 10 per cent. The value attributed to the shareholders' interest in the estate is derived by increasing final bonus rates (and related shareholder transfers) so as to exhaust the estate over the lifetime of the in-force with-profits

business. In any scenarios where the total assets of the life fund are insufficient to meet policyholder claims in full, the excess cost is fully attributed to shareholders. Similar principles apply, where appropriate, for other with-profits funds of the Group's Asia operations.

(v) Debt capital

Core structural debt liabilities are carried at market value. As the liabilities are generally held to maturity or for the long-term, no deferred tax asset or liability has been established on the difference, compared to the IFRS carrying value. Accordingly, no deferred tax credit or charge is recorded in the results for the reporting period in respect of the mark to market value adjustment.

(vi) Foreign currency translation

Foreign currency profits and losses have been translated at average exchange rates for the period. Foreign currency assets and liabilities have been translated at period end rates of exchange. The principal exchange rates are shown in note A1 of the IFRS statements.

(c) Accounting presentation

(i) Analysis of post-tax profit

To the extent applicable, the presentation of the EEV post-tax profit for the period is consistent in the classification between operating and non-operating results with the basis that the Group applies for the analysis of IFRS basis results. Operating results reflect underlying results including longer-term investment returns (which are determined as described in note 14(c)(ii) below) and incorporate the following:

- new business contribution, as defined in note 14(b)(i);
- · unwind of discount on the value of in-force business and other expected returns, as described in note 14(c)(iv) below:
- the impact of routine changes of estimates relating to non-economic assumptions, as described in note 14(c)(iii) below; and
- non-economic experience variances, as described in note 14(c)(v) below.

Non-operating results comprise the recurrent items of short-term fluctuations in investment returns, the mark to market value movements on core borrowings and the effect of changes in economic assumptions.

In addition, operating profit for half year 2014 and full year 2013 excludes the costs associated with the domestication of the Hong Kong branch and also for 2013 the loss attaching to the held for sale Japan Life business. Total profit attributable to shareholders and basic earnings per share include these items, together with actual investment returns. The Company believes that operating profit, as adjusted for these items, better reflects underlying performance.

(ii) Post-tax operating profit

For the investment element of the assets covering the net worth of long-term insurance business, investment returns are recognised in operating results at the expected long-term rate of return. These expected returns are calculated by reference to the asset mix of the portfolio. For the purpose of calculating the longer-term investment return to be included in the operating result of the PAC with-profits fund of UK operations, where assets backing the liabilities and unallocated surplus are subject to market volatility, asset values at the beginning of the reporting period are adjusted to remove the effects of short-term market movements as explained in note 14(c)(iv) below.

For the purpose of determining the long-term returns for debt securities of US operations for fixed annuity and other general account business, a risk margin charge is included which reflects the expected long-term rate of default based on the credit quality of the portfolio. For Jackson, interest-related realised gains and losses are amortised to the operating results over the maturity period of the sold bonds and for equity-related investments, a long-term rate of return is assumed, which reflects the aggregation of end of period risk-free rates and equity risk premium. For US variable annuity separate account business, operating profit includes the unwind of discount on the opening value of

in-force adjusted to reflect end of period projected rates of return with the excess or deficit of the actual return recognised within non-operating profit, together with the related hedging activity.

For UK annuity business, rebalancing of the asset portfolio backing the liabilities to policyholders may, from time to time, take place to align it more closely with the internal benchmark of credit quality that management applies. Such rebalancing will result in a change in the projected yield on the asset portfolio and the allowance for default risk. The net effect of these changes is included in the result for the period.

(iii) Effect of changes in operating assumptions

Operating profit includes the effect of changes to operating assumptions on the value of in-force at the end of the period. For presentational purposes, the effect of change is delineated to show the effect on the opening value of in-force with the experience variance being determined by reference to the end of period assumptions.

(iv) Unwind of discount and other expected returns

The unwind of discount and other expected returns is determined by reference to:

- the value of in-force business at the beginning of the period (adjusted for the effect of current period economic and operating assumption changes); and
- · required capital and surplus assets.

In applying this general approach, the unwind of discount included in operating profit for the with-profits business of UK insurance operations is determined by reference to the opening value of in-force, as adjusted for the effects of short-term investment volatility due to market movements (ie smoothed). In the summary statement of financial position and for total profit reporting, asset values and investment returns are not smoothed. At 30 June 2014 the shareholders' interest in the smoothed surplus assets used for this purpose only, were £123 million lower (30 June 2013: £25 million lower; 31 December 2013: £136 million lower) than the surplus assets carried in the statement of financial position.

(v) Operating experience variances

Operating profits include the effect of experience variances on non-economic assumptions, which are calculated with reference to the embedded value assumptions at the end of the reporting period, such as persistency, mortality and morbidity, expenses and other factors.

(vi) Internal asset management

The new business and in-force results from long-term business include the projected value of profits or losses from asset management and service companies that support the Group's covered insurance businesses. The results of the Group's asset management operations include the current period profits from the management of both internal and external funds. EEV basis shareholders' other income and expenditure is adjusted to deduct the unwind of the expected internal asset management profit margin for the period. The deduction is on a basis consistent with that used for projecting the results for covered insurance business. Group operating profit accordingly includes the variance between actual and expected profit in respect of management of the covered business assets.

(vii) Pension costs

Movements on the shareholders' share of surpluses (to the extent not restricted by IFRIC 14) and deficits of the Group's defined benefit pension schemes adjusted for contributions paid in the period are recorded within Other Comprehensive Income.

Consistent with the basis of distribution of bonuses and the treatment of the estate described in notes 14(b)(i) and (iv), the shareholders' share incorporates 10 per cent of the proportion of the financial position attributable to the PAC with-profits fund. The financial position is determined by applying the requirements of IAS 19 as booked for IFRS reporting.

(viii) Effect of changes in economic assumptions

Movements in the value of in-force business at the beginning of the period caused by changes in economic assumptions, net of the related change in the time value of cost of option and guarantees, are recorded in non-operating results.

(ix) Taxation

In determining the post-tax profit for the period for covered business, the overall tax rate includes the impact of tax effects determined on a local regulatory basis. Tax payments and receipts included in the projected cash flows to determine the value of in-force business are calculated using rates that have been announced and substantively enacted by the end of the reporting period.

(x) Inter-company arrangements

The EEV results for covered business incorporate annuities established in the PAC non-profit sub-fund from vesting pension polices in SAIF (which is not covered business). The EEV results also incorporate the effect of the reinsurance arrangement of non-profit immediate pension annuity liabilities of SAIF to PRIL. In addition, the free surplus and value of in-force business are calculated after taking account of the impact of contingent loan arrangements between Group companies (movements in the contingent loan liability are reflected via the projected cash flows in the value of in-force and the related funding is reflected in free surplus).

15 Assumptions

Deterministic assumptions

The tables below summarise the principal financial assumptions:

Assumed investment returns reflect the expected future returns on the assets held and allocated to the covered business at the valuation date.

(i) Asia operationsnotes (b), (d)

Equity risk premiums in Asia (excluding those for the held for sale Japan Life business) range from 3.5 per cent to 8.7 per cent for all periods throughout these results.

Notes

- (a) The weighted risk discount rates for Asia operations shown above have been determined by weighting each country's risk discount rates by reference to the post-tax EEV basis new business result and the closing value of inforce business. The changes in the risk discount rates for individual Asia territories reflect the movements in government bond yields, together with the effects of movements in the allowance for market risk and changes in product mix.
- (b) For Hong Kong the assumptions shown are for US dollar denominated business. For other territories, the assumptions are for local currency denominated business.
- (c) The mean equity return assumptions for the most significant equity holdings in the Asia operations were:

	2014 %	2013	3 %	
	30 Jun	30 Jun	31 Dec	
Hong Kong	6.6	6.5	7.1	
Malaysia	10.1	9.6	10.1	
Singapore	8.4	8.4	8.6	

(d) The local tax rates applicable for the most significant operations for all periods shown, are as follows:

Assumed corporate tax rate %
Hong Kong
16.5 per cent on 5 per cent of premium income
25 per cent
2013 to 2015: 25 per cent; From 2016: 24 per
Malaysia
Singapore
17 per cent

Assumed corporate tax rate	35.0	35.0	35.0

^{*} including the proportion of variable annuity business invested in the general account

Notes

- (a) The assumed new business spread margins represent the difference between the earned rate on investments, after allowance for long-term defaults, and the policy holder crediting rate. The spread margins shown above are the rates at inception. For fixed annuity business (including the proportion of variable annuity business invested in the general account) and fixed index annuity business, the assumed spread margin grades up linearly by 25 basis points to a long-term assumption over five years.
- (b) The allowance for long-term defaults included in projected spread is shown as at the valuation date applied in the cash flow projections of the value of the in-force business. The risk discount rates include an additional allowance for credit risk premium and short-term downgrades and defaults. See note 14(b)(iii) for further details.
- (c) The weighted average risk discount rates reflect the mix of business between variable annuity and non-variable annuity business. The decrease in the weighted average risk discount rates from half year 2013 to half year 2014 primarily reflects the effect of the decrease in additional allowance for credit risk and the effects of movement in the allowance for market risk, partly offset by the increase in the US 10-year Treasury bond rate of 10 basis points.

Notes

(b) Credit spread treatment

For Prudential Retirement Income Limited, which has approximately 90 per cent of UK shareholder-backed annuity business, the credit assumptions used in the underlying MCEV calculation (see note 14(b)(iii)) and the residual liquidity premium element of the bond spread over swap rates are as follows:

	2014				
In-force business	(bps)	2013 (1	2013 (bps)		
	30 Jun	30 Jun	31 Dec		
Bond spread over swap rates	119	157	133		
Total credit risk allowance	61	64	62		
Liquidity premium	58	93	71		
	2014				
Individual annuity new business	(bps)	2013 (bps)			
	30 Jun	30 Jun	31 Dec		
Bond spread over swap rates	121	116	117		
Total credit risk allowance	34	38	37		
Liquidity premium*	87	78	80		

^{*} The new business liquidity premium is based on the weighted average of the point of sale liquidity premia.

The overall allowance for credit risk is prudent by comparison with historic rates of default and would be sufficient to withstand a wide range of extreme credit events over the expected lifetime of the annuity business.

Stochastic assumptions

The economic assumptions used for the stochastic calculations are consistent with those used for the deterministic calculations described above. Assumptions specific to the stochastic calculations, such as the volatilities of asset returns, reflect local market conditions and are based on a combination of actual market data, historic market data and an assessment of longer-term economic conditions. Common principles have been adopted across the Group for the stochastic asset models, for example, separate modelling of individual asset classes but with allowance for correlation between the various asset classes.

Details are given below of the key characteristics and calibrations of each model.

⁽a) For shareholder-backed annuity business, the movements in the pre-tax long-term nominal rates of return and the risk discount rates for in-force business mainly reflect the effect of changes in asset yields.

(iv) Asia operations

- The same asset return models as described for UK insurance operations below, appropriately calibrated, have been used for Asia operations. The principal asset classes are government and corporate bonds. Equity holdings are much lower than in the UK whilst property holdings do not represent a significant investment asset;
- the stochastic cost of guarantees is primarily only of significance for the Hong Kong, Korea, Malaysia and Singapore operations; and
- the mean stochastic returns are consistent with the mean deterministic returns for each country. The expected volatility of equity returns ranges from 18 per cent to 35 per cent for all periods throughout these results, and the volatility of government bond yields ranges from 0.9 per cent to 2.3 per cent for all periods throughout these results.

(v) US operations (Jackson)

- Interest rates are projected using a log-normal generator calibrated to historical US Treasury yield curves;
- corporate bond returns are based on Treasury securities plus a spread that has been calibrated to current market conditions and varies by credit quality; and
- variable annuity equity returns and bond interest rates have been stochastically generated using a log-normal
 model with parameters determined by reference to historical data. The volatility of equity fund returns ranges
 from 19 per cent to 32 per cent for all periods throughout these results, depending on the risk class and the class
 of equity, and the standard deviation of interest rates ranges from 2.2 per cent to 2.5 per cent for all periods
 throughout these results.

(vi) UK insurance operations

- Interest rates are projected using a two-factor model calibrated to the initial market yield curve;
- the risk premium on equity assets is assumed to follow a log-normal distribution;
- the corporate bond return is calculated as the return on a zero-coupon bond plus a spread. The spread process is a mean reverting stochastic process; and
- property returns are modelled in a similar fashion to corporate bonds, namely as the return on a risk-free bond, plus a risk premium, plus a process representative of the change in residual values and the change in value of the call option on rents.

Mean returns have been derived as the annualised arithmetic average return across all simulations and durations.

For each projection period, standard deviations have been calculated by taking the square root of the annualised variance of the returns over all the simulations. These have been averaged over all durations in the projection. For equity and property, the standard deviations relate to the total return on these assets. The standard deviations applied for all periods are as follows:

<i>7</i> 0

Notes

The format of the tables shown above is consistent with the distinction between insurance and investment products as applied for previous financial reporting periods. With the exception of some US institutional business, products categorised as 'insurance' refer to those classified as contracts of long-term insurance business for regulatory reporting purposes, ie falling within one of the classes of insurance specified in Part II of Schedule 1 to the Regulated Activities Order under PRA regulations.

⁽i) The tables shown above are provided as an indicative volume measure of transactions undertaken in the reporting period that have the potential to generate profits for shareholders. The amounts shown are not, and not intended to be, reflective of premium income recorded in the IFRS income statement.

The details shown above for insurance products include contributions for contracts that are classified under IFRS 4 'Insurance Contracts' as not containing significant insurance risk. These products are described as investment contracts or other financial instruments under IFRS. Contracts included in this category are primarily certain unit-linked and similar contracts written in UK insurance operations and Guaranteed Investment Contracts and similar funding agreements written in US operations.

- (ii) New business in China is included at Prudential's 50 per cent interest in the China life operation.
- (iii) New business in India is included at Prudential's 26 per cent interest in the India life operation.
- (iv) Investment products referred to in the tables for fund under management above are unit trust, mutual funds and similar types of retail fund management arrangements. These are unrelated to insurance products that are classified as 'investment contracts' under IFRS 4, although similar IFRS recognition and measurement principles apply to the acquisition costs and fees attaching to this type of business.
- (v) Investment flows for the half year exclude Eastspring Money Market Funds gross inflows of £32,065 million (half year 2013: £30,774 million) and net outflows of £52 million (half year 2013: net inflows of £107 million).
- (vi) New business and market gross inflows and redemptions have been translated at an average exchange rate for the period applicable. Funds under management at points in time are translated at the exchange rate applicable to those dates.

Additional Unaudited Financial Information

A New Business

BASIS OF PREPARATION

The format of the schedules is consistent with the distinction between insurance and investment products as applied for previous financial reporting periods. With the exception of some US institutional business, products categorised as 'insurance' refer to those classified as contracts of long-term insurance business for regulatory reporting purposes, ie falling within one of the classes of insurance specified in part II of Schedule 1 to the Regulated Activities Order under PRA regulations.

The details shown for insurance products include contributions for contracts that are classified under IFRS 4 'Insurance Contracts' as not containing significant insurance risk. These products are described as investment contracts or other financial instruments under IFRS. Contracts included in this category are primarily certain unit-linked and similar contracts written in UK Insurance Operations, and Guaranteed Investment Contracts and similar funding agreements written in US Operations.

New business premiums for regular premium products are shown on an annualised basis. Internal vesting business is classified as new business where the contracts include an open market option. New business premiums reflect those premiums attaching to covered business, including premiums for contracts designed as investment products for IFRS reporting.

Investment products referred to in the tables for funds under management are unit trusts, mutual funds and similar types of retail fund management arrangements. These are unrelated to insurance products that are classified as investment contracts under IFRS 4, as described in the preceding paragraph, although similar IFRS recognition and measurement principles apply to the acquisition costs and fees attaching to this type of business.

New Business Profit (post-tax) has been determined using the European Embedded Value (EEV) methodology and assumptions set out in our 2014 Interim Report.

In determining the EEV basis value of new business written in the period policies incept, premiums are included in projected cash flows on the same basis of distinguishing annual and single premium business as set out for statutory

basis reporting.

Annual premium equivalent (APE) sales are subject to rounding.

Notes to Schedules A(i) to A(ix)

(1) Prudential plc reports its results at both actual exchange rates (AER) and constant year-to-date average exchange rates (CER) so as to eliminate the impact of exchange translation.

between the year-to-date reported sterling results at successive quarters and will include foreign exchange movements from earlier periods.

⁽¹a) Insurance and investment new business for overseas operations are converted using the year-to-date average exchange rate applicable at the time (AER). The sterling results for individual quarters represent the difference

⁽¹b) Insurance new business for overseas operations for 2013 has been calculated using constant exchange rates (CER).

⁽¹c) Constant exchange rates have been used to calculate insurance new business for overseas operations for all periods in 2013 and 2014.

⁽²⁾ Annual Equivalents, calculated as regular new business contributions plus 10 per cent of single new business contributions, are subject to roundings. Present value of new business premiums (PVNBPs) are calculated as

equalling single premiums plus the present value of expected premiums of new regular premium business. In determining the present value, allowance is made for lapses and other assumptions applied in determining the EEV new

business profit.

- (3) Balance includes segregated and pooled pension funds, private finance assets and other institutional clients.

 Other movements reflect the net flows arising from the cash component of a tactical asset allocation fund managed by PPM South Africa.
- (4) New business in India is included at Prudential's 26 per cent interest in the India life operation.
- (5) Balance Sheet figures have been calculated at the closing exchange rate.
- (6) New business in China is included at Prudential's 50 per cent interest in the China life operation.
- (7) Mandatory Provident Fund (MPF) product sales in Hong Kong are included at Prudential's 36 per cent interest in Hong Kong MPF operation.
- (8) Investment flows for the period exclude Eastspring Money Market Funds (MMF) gross inflows of £32,065 million (Half year 2013: £30,774 million) and net outflows of £52 million (Half year 2013 net inflows: £107 million).
- (9) Excludes Curian Variable Series Trust funds (internal funds under management).
- (10) Total M&G and Eastspring excluding MMF. Funds under management for MMF amounted to £4,300 million at 30 June 2014 (30 June 2013: £4,267 million).
